

Global Button Border Radius “Site Settings” on Normal state doesn’t work

I am using global fonts, global colors, and global button style settings to take affect over my entire website. So if I want change the color or appearance of my buttons, I only have to make one change in the global settings. I want to avoid making individual style changes on each element.

I think I may have found a bug in the “site settings” global border radius setting for normal button state. See the attached PDF showing the rounded border settings I want for both the normal and hover states.

You will see that although I have the same “25” settings for both normal and hover, the normal state remains squared off.

However, if I edit the button’s local style settings and add the “25” border settings, the rounded normal state works. But if I have to override the “site settings” global button settings on every button, this defeats my goal of “single change” in one place.

Am I missing something in the way I am setting and using the global button site settings?
